
Vertex Systems ADL13 Vertex v4.0 with New for Windows

I'd like to be able to replace just the values in the U and V fields of the sphere. Any changes to the vertex positions, radiuses or weights would be overwritten. Any advice is greatly appreciated. A: So here is the (not totally clean) way I ended up doing it. Hopefully it's helpful to someone else. While editing the U and V values of the Vertex controls (in the Properties tab), the control has a box by it that says 'Attribute' (or something like that). The attribute that you select is called Vertex Weight. Set that to the U and V you want to change (while choosing Vertex Weight, be sure to press 'Apply'). Step 3: Create a new Vertex vertex double (or anything you like) and assign this vertex to the sphere (as 'Vertex' in the options). Step 4: Set the values of the vertex double to the values of the control you want (either in the Properties view or in the Properties tab, or in code if you don't use the Properties view) Hope this helps. Dynamic tissue changes in the rat left ventricle after myocardial infarction studied by a three dimensional strain map.

Dynamic tissue changes in the left ventricle after myocardial infarction were investigated by using a 3-dimensional strain map technique. The circumflex coronary artery was occluded in 7, 30, 60, and 90 day old rats after the ligation of the left anterior descending coronary artery. In each age, the myocardial infarction size and left ventricular volume were determined by using the monastrol technique. The circumflex coronary artery flow was measured by an electromagnetic flowmeter. In the normal control rats the circumflex coronary blood flow was stable (93 ± 10 microliters/min/100g BW), but after 30 days it decreased to $19 \pm 5\%$ compared to the pre-operative level. The left ventricular volume was significantly decreased from the sham operated to the infarcted region and the fractional volume of the infarcted region was significantly larger in the 30 day old animals than the 7 and 60 day old animals. The circumflex coronary blood flow was further decreased from the 30 day old to the 60 and 90 day old animals. In the 7 day old animals, the epicardial circumferential strains in the infarcted region were $-24.2\% \pm 2.6\%$
