Should I install Ubuntu on a computer that does not have an external hard drive? I ask this because I've noticed that there are Ubuntu 12.04.4 ISOs available that do not include the installer tool, i.e. "ubuntu-12.04.4-desktop-386.iso" However I can see that there are Ubuntu 13.04 ISOs that include the installer tool i.e. "ubuntu-13.04-desktop-386.iso" Is the installer tool a requirement for a computer to be able to run Ubuntu or is it simply a preference? I ask this because I have an old computer that does not have an internal hard drive and I have discovered that there are Ubuntu ISOs that do not include the installer tool. A: It is a requirement to install Ubuntu on a computer that has a physical hard drive. That doesn't mean you can't do it without the installer, just that you will need a way to physically load the operating system into RAM. There are a few ways to do this, but probably the most common is to use a USB flash drive or CD/DVD to install to. Another method is to use a virtual machine and install to that. Q: Choosing a board for a Hadoop installation I'm attempting to set up a Hadoop cluster on a 2 node cluster (dual quad-core, single core) machine with 8Gb of RAM (using CentOS 5.2). I'd like to use two 12" MacBook Pros, one of them 82157476af
